

Automatic Hot Slab Spray Marker in Continuous Casting Lines*

Akimune SATO** Tsuyoshi TSUCHIDA**

It has long been a challenging problem to automate a marking work required on red-hot slabs for their classification.

stencil as it is expendable. Besides, the paper is so flexible as to stick to uneven surface of slab, contributing to obtaining clear marking. A question was how to stop the burning of paper when it touched red-hot slab. After a number of experiments including wetting and thickening of stencil, the problem was solved as follows.

2.2.2 Temporary water cooling of limited slab surface

Basic idea is not to cool the slab surface by

Actually, it is hardly possible that surface temper-
