

KAWASAKI STEEL TECHNICAL REPORT

No.26 (June 1992)

Artificial Intelligence and Wire Rods and Steel Bars

Establishment of Basic Infrastructure for Expert System Development

Satoshi Fukumura, Katsuaki Sanou

Synopsis :

With a view to disseminating expert system (ES) applications within the company, Kawasaki Steel conducted a special program for strengthening fundamentals of its system development. As a central measure, ES development guide book was compiled to standardize development procedures, and a software was developed as supporting tools for ES building standards. The former summarized proper selection standards for ES applications, ES development processes, and job analysis at each process and its keypoints. The latter mainly emphasized eliminating computer environment dependency, the ease of gaining the mastery of tools, and a design for a hypothetical reasoning unction useful in solving vital planning problems in the future. Since 1989, the number of applications using these tools has increased, contributing notably to effective and efficient system development.
