Synopsis :

To cover a 150MW (at 300MW capacity) increase in power requirement for a new No.6 blast furnace, Q-BOP shop, No.3 slabbing mill and their auxiliary equipment at West Plant, Chiba Works reinforced the west substation for a raised purchase from outside source and built the west power plant for captive use, including related facilities. In this project, the emphasis was placed on saving labor and energy, protection of environmental quality, easy maintenance, and an efficient coordination with the power plant and substation which already existed at the Main Plant. One of the features of the project is the utility computer system for a centralized energy management of both areas and the tele-control system for the west substation and the fuel supply equipment.

工芸制全生元五工十日、アラセ、仕合組機の概要

ステム) の採用による燃料設備の一元管理と省エネルギーの徹底。

(2) 第6高炉炉頂圧回復装置設備の設置

として再熱蒸気ラインに 30t/h の抽気装置を設けた。

(2) ボイラの省エネルギー

- (4) 受変電設備にガス絶縁開閉設備の採用。  
(5) 第3製鋼OGボイラー、自家発電所内抽気設

- (a) 各使用ガスのボイラー入口部に緊急水封弁を設けた。
